

## Software Installation Manual

The repository for this project is located at: <https://github.com/lovelysandlonelys/MaintainControl>

- Download the zip file that contains Maintain Control
- Extract the file
- Open Visual Studio Code
- It's highly possible that your Visual Studio will not have a package for running java programs installed.
  - If this is the case google "Install Visual Studio Code for Java" and install the coding pack for java.
- Open a the MaintainControl-Master file in Visual Studio Code
- Because we use a text file method for saving information to our application you will have to replace the file path in the code with the appropriate file path.
  - Anywhere that you see
    - C:\\Users\\steph\\SCHOOL\\Dev\\MaintainControl\\src\\maintainControl\\EventFile.txt
    - EventClass.java, MonthlyScreen.java, WeeklyScreen.java, DailyScreen.java, FreeTime.java, all have this file path.
    - Click into EventClass.java and press the control key and then press f while holding down the control key.
      - This way you can search up the file name and replace all the instances of it in the file by only typing out your file path once! You can then click through the other files and replace all of the instances of my file path with the file path that you need for the program to run.
      - if you hover over EventFile.txt in the file explorer of visual studio code then you can see what the path should be!
    - After replacing the file path with the correct one the program will run. Be careful to follow the series of directories exactly and make sure that every time you see a \ type \\ instead.
- Navigate to MaintinaControlDriver.java in the file explorer area of Visual Studio Code and run it.

Thank You for choosing our application!
